WindSoHy's business advantage stems from combining clean, efficient, cost-effective and renewable energy technologies to create greater sustainability and profitability.

Compressed Air Energy Storage (CAES) is rapidly gaining recognition as the most cost-effective and reliable source of baseload power available today. By integrating wind power with CAES and Hydrogen, WindSoHy will become one of the world's first producers of totally renewable baseload, peak demand power.

Links to detailed information about WindSoHy's renewable technologies are found on specific technology pages. Please click on a specific technology to learn more.
